ABSTRACT

An electronic device has a timepiece with a dial face. The dial face comprises a display monitor for providing a graphical representation of a scheduled event. The representation comprises a segment whose length is associated with the duration of the event and whose graphical attributes correspond with a type of the scheduled event as specified by the user in advance. The device is, for example, a watch that communicates with the user's PDA through a Bluetooth link in the user's Personal Area Network (PAN).
